L5 ANSWER 1 OF 9 USPATFULL on STN
TI Prolonged anesthesia in joints and body spaces
AB Sustained release local anesthetic formulations are administered intra
articularly and/or into body spaces/cavities. The formulation is
preferably a plurality of injectable microparticles including a local
anesthetic and an effective amount of a biocompatible, biodegradable,
sustained release material prolonging the release of the local
anesthetic and optionally and a pharmaceutically acceptable, i.e.,
non-toxic, augmenting agent effective to prolong the duration of the
local anesthesia for a time period longer than that obtainable without
the augmenting agent.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L5 ANSWER 2 OF 9 USPATFULL on STN

TI Vaccines against diseases caused by enteropathogenic organisms using antigens encapsulated within biodegradable-biocompatible microspheres

AB This invention relates to an immunostimulating composition comprising encapsulating microspheres, which may contain a pharmaceutically-acceptable adjuvant, wherein said microspheres having a diameter between 1 nanometer (nm) to 10 microns (um) are comprised of (a) a biodegradable-biocompatible poly(DL-lactide-co-glycolide) as the bulk matrix, wherein the relative ratio between the amount of lactide and glycolide components are within the range of 40:60 to 0:100 and wherein said poly (DL-lactide-co-glycolide) is present in an uncapped form and an end-capped form wherein a ratio of uncapped to end-capped forms is 99/1 to 1/99, and (b) an immunogenic substance comprising Colony Factor Antigen (CFA/II), hepatitis B surface antigen (HbsAg), or a physiologically similar antigen that serves to elicit the production of antibodies in animal subjects. The preparation of its composition and its use as a vaccine is also disclosed.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L5 ANSWER 3 OF 9 USPATFULL on STN

TI Formulations and methods for providing prolonged local anesthesia
AB A formulation for inducing sustained regional local anesthesia in a patient comprising a substrate comprising a local anesthetic and an effective amount of a biocompatible, biodegradable, controlled release material prolonging the release of the local anesthetic from the substrate to obtain a reversible local anesthesia when implanted or injected in a patient, and a non-toxic augmenting agent effective to prolong the duration of the local anesthesia for a time period longer than that obtainable from the substrate without the augmenting agent. In preferred embodiments, the controlled release material is a low molecular weight, acid-terminated polymer. A further aspect of the invention is directed to such formulations which release the local anesthetic in two phases, the first a rapid "bolus" to initiate anesthesia and a second, slower release to maintain anesthesia.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L5 ANSWER 9 OF 9 WPIDS COPYRIGHT 2004 THOMSON DERWENT on STN

TI **Microcapsule** compositions for burst-free, sustained release of active agents - comprising active agent and blend of uncapped and end-capped biodegradable **poly(lactide/glycolide)**.

AN 1997-393337 [36] WPIDS

CR 1991-295351 [40]; 1995-199683 [26]; 1996-019737 [02]; 1998-031704 [03]; 1998-129287 [12]; 1998-347245 [30]; 1998-437043 [37]; 2001-396353 [42]; 2003-101718 [09]; 2003-615263 [58]; 2003-730043 [69]; 2003-730422 [69]

AB WO 9726869 A UPAB: 20031027

The following are claimed: (A) a controlled release **microcapsule** pharmaceutical formulation, for burst-free, sustained, programmable release of a biologically active agent over 1-100 days, comprising an active agent and a blend of uncapped and end-capped biodegradable **poly(lactide/glycolide)** (PLG). (B) preparing controlled release **microcapsule** formulations characterised by burst-free, sustained, programmable release of biologically active agents, comprising: (a) dissolving biodegradable PLG, in uncapped or end-capped form, in methylene chloride, and dissolving an active agent or active core in water; (b) adding the aqueous layer to the polymer solution and emulsifying to provide an inner water-in-oil emulsion; (c) stabilising the emulsion in a solvent-saturated aqueous phase containing an oil-in-water emulsifier; (d) adding the water-in-oil emulsion to an external aqueous layer containing oil-in-water emulsifier to form a ternary emulsion; and (e) stirring the resulting water-in-oil-in-water emulsion for sufficient time to remove the solvent, rinsing the **hardened** microcapsules with water, and lyophilising the microcapsules.

USE - The microcapsules are useful for sustained, burst-free, release of active agents, e.g., polypeptides, over long periods of time.

ADVANTAGE - The microcapsules show high encapsulation efficiency. The carrier polymer is completely degraded to innocuous components. The microcapsules are easily administered via, e.g., oral, parenteral, topical, nasal or vaginal routes.

L13 ANSWER 1 OF 17 USPATFULL on STN

TI Vaccines against diseases caused by enteropathogenic organisms using antigens encapsulated within biodegradable-biocompatible microspheres

AB This invention relates to an immunostimulating composition comprising encapsulating microspheres, which may contain a pharmaceutically-acceptable adjuvant, wherein said microspheres having a diameter between 1 nanometer (nm) to 10 microns (um) are comprised of (a) a biodegradable-biocompatible poly(DL-lactide-co-glycolide) as the bulk matrix, wherein the relative ratio between the amount of lactide and glycolide components are within the range of 40:60 to 0:100 and wherein said poly (DL-lactide-co-glycolide) is present in an uncapped form and an end-capped form wherein a ratio of uncapped to end-capped forms is 99/1 to 1/99, and (b) an immunogenic substance comprising Colony Factor Antigen (CFA/II), hepatitis B surface antigen (HbsAg), or a physiologically similar antigen that serves to elicit the production of antibodies in animal subjects. The preparation of its composition and its use as a vaccine is also disclosed.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L13 ANSWER 9 OF 17 USPATFULL on STN

TI Extraction process for producing PLGA microspheres
AB A hybrid evaporation-extraction process for preparing microspheres of a
p(DL-lactide-to-glycolide) biodegradable polymer, comprising:

a. preparing a lyophilized biologically active material-sucrose matrix;
adding acetonitrile solvent to biologically active material-sucrose
matrix to form a solution;

b. preparing a solution of a biodegradable poly (DL-lactide-co-
glycolide) polymer by adding acetonitrile solvent to the polymer;

c. adding the biodegradable poly (DL-lactide-co-glycolide) polymer
acetonitrile solution to the biologically active material-sucrose
acetonitrile solution;

d. adding with stirring an oil containing lecithin to the poly
(DL-lactide-co-glycolide) polymer-sucrose-biologically active material
solution to evaporate acetonitrile and form an emulsion containing
microspheres of poly (DL-lactide-co-glycolide) biodegradable polymers;

e. adding the emulsion from step d. into a solvent selected from
heptane, hexane, pentane or isopropanol; and

f. collecting microspheres of poly (DL-lactide-co-glycolide)
biodegradable polymers of from 1.0 to about 10.0 micrometers after
filtration and washing with a fresh solvent selected from heptane,
hexane, pentane or isopropanol.

TI Microsphere drug application device
AB Apparatus and methods for dispensing medicinals encapsulated in a biodegradable polymer in surgical and other wounds are described. The apparatus, a microcapsule drug applicator, allows the caregiver to implant or spread measured and uniform quantities of microencapsulated medicinals in or on surgical or traumatic wounds to prevent and/or treat infections. Specific examples where microencapsulated antibiotics may prove useful include, soft-tissue wounds, following debridement and reduction or fixation of open fractures, to osteomyelitic bone after surgical debridement, after surgical insertion of prostheses such as hip/knee replacements (arthroplasty), and following vascular surgery or grafting.

L13 ANSWER 16 OF 17 BIOSIS COPYRIGHT 2004 BIOLOGICAL ABSTRACTS INC. on STN
TI Effect of microencapsulated ampicillin on cell-mediated immune responses in mice.

AB The effects of free ampicillin, microencapsulated ampicillin anhydrate (MEAA) and antibiotic-free microspheres on the cell-mediated immune response in Balb/c mice were measured by lymphoproliferation assay, delayed-type hypersensitivity (DTH) and cytokine production. Injection into mice for seven consecutive days with equivalent subcutaneous doses of ampicillin, MEAA or placebo microspheres did not produce any consistent change in lymphocyte proliferation nor did it affect DTH responses or interleukin-2 production. Although the production of interleukin-4 in mice treated with ampicillin or MEAA increased compared with the control mice, this increase was not statistically significant. These results indicate that ampicillin and MEAA have similar effects on cell-mediated immunity in mice.

L15 ANSWER 1 OF 9 USPATFULL on STN

TI Vaccines against diseases caused by enteropathogenic organisms using
antigens encapsulated within biodegradable-biocompatible microspheres
AB This invention relates to an immunostimulating composition comprising
encapsulating microspheres, which may contain a pharmaceutically-
acceptable adjuvant, wherein said microspheres having a diameter between
1 nanometer (nm) to 10 microns (um) are comprised of (a) a
biodegradable-biocompatible poly(DL-lactide-co-glycolide) as the bulk
matrix, wherein the relative ratio between the amount of lactide and
glycolide components are within the range of 40:60 to 0:100 and wherein
said poly (DL-lactide-co-glycolide) is present in an uncapped form and
an end-capped form wherein a ratio of uncapped to end-capped forms is
99/1 to 1/99, and (b) an immunogenic substance comprising Colony Factor
Antigen (CFA/II), hepatitis B surface antigen (HbsAg), or a
physiologically similar antigen that serves to elicit the production of
antibodies in animal subjects. The preparation of its composition and
its use as a vaccine is also disclosed.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L16  ANSWER 1 OF 13      MEDLINE on STN

```

```

TI  Structure-activity relationship study of antimalarial indolo
    [2,1-b]quinazoline-6,12-diones (tryptanthrins). Three dimensional
    pharmacophore modeling and identification of new antimalarial candidates.

```

```

AB  A widely applicable three-dimensional QSAR pharmacophore model for
    antimalarial activity was developed from a set of 17 substituted
    antimalarial indolo[2,1-b]quinazoline-6,12-diones (tryptanthrins) that
    exhibited remarkable in vitro activity (below 100 ng/mL) against sensitive
    and multidrug-resistant Plasmodium falciparum malaria. The pharmacophore,
    which contains two hydrogen bond acceptors (lipid) and two hydrophobic
    (aromatic) features, was found to map well onto many well-known
    antimalarial drug classes including quinolines, chalcones, rhodamine dyes,
    Pfmrk cyclin dependent kinase inhibitors, malarial FabH inhibitors, and
    plasmepsin inhibitors. The phamacophore allowed searches for new
    antimalarial candidates from multiconformer 3D databases and enabled
    custom designed synthesis of new potent analogues.

L16 ANSWER 2 OF 13 MEDLINE on STN

TI Oral immunization of adult volunteers with microencapsulated enterotoxigenic Escherichia coli (ETEC) CS6 antigen.
AB As a step in the development of an oral vaccine against ETEC, we evaluated the safety and immunogenicity of CS6, a polymeric protein commonly found on the surface of ETEC. Formulations included 1 and 5mg doses of CS6, either encapsulated in biodegradable polymer poly(D, L)-lactide-co-glycolide (PLG), or as free protein, administered orally in a solution of either normal saline or a rice-based buffer. Three doses of CS6 were given at 2-week intervals. Blood was collected immediately before and 7 days after each dose. All formulations were well tolerated. Four of five volunteers who received 1mg CS6 in PLG microspheres with buffer had significant IgA ASC responses (median=30 ASC per 10(6) PBMC) and significant serum IgG responses (median=3.5-fold increase). Oral administration of these prototype ETEC vaccine formulations are safe and can elicit immune responses. The ASC, serum IgA, and serum IgG responses to CS6 are similar in magnitude to the responses after challenge with wild-type ETEC [Coster et al., unpublished data]. Further studies are underway to determine whether these immune responses are sufficient for protection.

TI Microparticle carriers of maximal uptake capacity by both M cells and non-M cells

AB In a solvent extraction process for preparing microspheres of a biodegrade polymer, the improvement comprising: preparing a homogenized antigen-sucrose matrix and adding a solvent to the sucrose-antigen matrix to form a solution; preparing a solution of a biodegradable polymer by adding a solvent to the polymer; adding the biodegradable polymer solution to the antigen-sucrose solution; adding an oil to the polymer-sucrose-antigen solution to form an emulsion having a controlled viscosity that corresponds to a predetermined average particle size of distributions of microspheres of biodegradable polymers; centrifuging

the emulsion of controlled viscosity and removing the supernatant to obtain microspheres of a predetermined range of particle size distributions of from about 0.5 to about 7.0 micrometers.

An immunostimulating composition comprising an encapsulating-microsphere of the biodegradable polymer has an average particle size distribution such that the majority of the microspheres will be taken up by the villous epithelium section of the intestines of a mammalian subject when administered as a vaccine against diseases caused by enteropathogenic organisms.
